

TIMS

Patch Notes

TIMS 26.1.12 – 11 August 2026

Summary

TIMS 26.1.12 is a maintenance patch release for TIMS 26.1. It resolves nine issues across the Despatch, Payroll and Workshop modules and web login.

Bug Fixes & Improvements

Despatch – Error when editing the shift sheet of an unallocated employee

Editing the shift sheet for an employee shown in the Open Work (unallocated) area of Despatch could cause an error when the change was saved, because TIMS attempted to refresh sign-on details that do not apply to unallocated entries. This has been fixed so shift sheet edits in the Open Work area save without error.

Despatch – Error when inserting a Sign On after the last Sign Off

In an employee's full-day shift sheet, right-clicking the final Sign Off line and choosing Insert, After, Sign On caused TIMS to fail while recalculating the shift duration. This was seen frequently at some sites. The duration calculation has been corrected so the new Sign On line is inserted normally.

Despatch – Yard Manager Plus info panel showed the wrong driver name

In Yard Manager Plus, the info panel did not show a driver name when the first bus in the yard was selected, and thereafter kept showing the same driver name regardless of which bus was selected. The panel now displays the correct driver for each selected bus.

Despatch – Yard Manager Plus zoom control hidden when the bus list was expanded

In the Yard Manager Plus Overhead view, expanding the bus list panel covered the zoom control so it could not be seen or used until the list was collapsed again. The zoom control now moves clear of the bus list when it is expanded and remains available at all times.

Payroll – Leave balances missing because accruals were not being loaded

Some employees' Leave Balances tab showed no information even though leave had accrued. The scheduled process that loads accrual records was not running correctly, leaving accrual data missing for affected employees. The accrual load process has been corrected so leave balances populate automatically without manual intervention.

Payroll – Standard payroll records for employees with no rostered work were not handled correctly

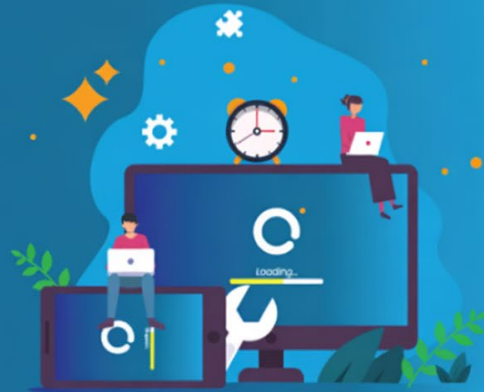

When running the payroll calculation, the step that removes standard payroll records for employees with no rostered work in the period was not matching employees correctly, so records could be retained or removed in error. The matching logic has been fixed so these records are handled as intended.

Payroll – QuickSuper export missing phone, mobile and email details

The QuickSuper superannuation export (Payroll, Export Super) included columns for the employee's phone, mobile and email address but left them blank, which prevented clients from meeting updated clearing house requirements. The export now

TIMS

Patch Notes

populates the phone and mobile numbers from the employee's Home and Mobile communication records (digits only) and the email address from the Classification tab.

Workshop – Fuel sheets failed to post when a quantity had no item code

On manual and adjustment fuel sheets, an oil, coolant or AdBlue quantity could be entered on a line without a matching item code. The problem only came to light when the sheet was posted, where it failed with an unclear journal balancing error. The fuel sheet screen now requires an item code whenever one of these quantities is entered and displays a clear message at the time of entry, so sheets post correctly.

General – Web login failed when accessed through a firewall or CDN

Logging in to TIMS web views through some customer firewall or content delivery services failed, because the connection details forwarded by those services were longer than TIMS could store. Logging in directly to TIMS was unaffected. TIMS now accepts the longer connection details so web login works reliably through these services.
