

New batch processing system

TIMS v24.2 replaces the legacy batch processing system with an enhanced technology stack across all modules. This change will result in speed improvements when performing calculations within the work order and receiving postings

While the team at Trapeze has performed testing prior to the release of TIMS v24.2, due to the highly customisable nature of TIMS we recommend full testing of all processes, particularly bespoke solutions provided to you by the team at Trapeze prior to upgrading to v24.2. If you would like to discuss this process, please reach out to the Trapeze team via support@trapezegrup.com.au

Enhancements

Item Warranty Warning on Workshop Touch Screen

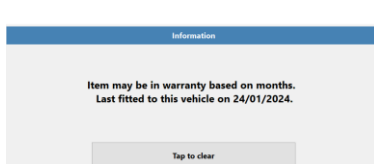

There has been an information box in TIMS Work Orders advising an item is possibly covered under warranty for sometime, this has now been extended to the Workshop Touch screen.

When an Item has a warranty timing/km/hrs set up on the General tab, and the item is used within the warranty timeframe a new pop-up will display on the Workshop Touchscreen, this gives the mechanics a warning that the item maybe covered under warranty, to hand the item to selected internal staff member.

To clear the information box – click to clear.

Internal processes can be established on who will get these items, whether the item will be claimed back from the supplier etc. However now the mechanic knows the item is possibly under warranty and cuts down on the items thrown away without management option to go back for warranty or use a different item or supplier in the future.

Outstanding Warranties will be found in Service Calendar last number box along the top.

System Fixes

- Previously when copying a model all fields would copy except Manufacturer, which would populate with the first manufacturer. Now the Model will copy all fields
